SCDD_G tm_21	4.3.3	Gtm Function																														
SCDD_G tm_29	4.3.3.1	ASIL Function																														
SCDD_G tm_56	4.3.3.1.1	SET_PWMSR0(n,sr0)																														
SCDD_G tm_57	This function is a macro function, which will write SR0 value to TOMx_CHy_SR0 register. The address of this register is stored in PwmSr0Pt. The input of this function is the index of PwmSr0Pt and SR0 value.																															
SCDD_G tm_58	4.3.3.1.2	SET_PWMSR1(n,sr1)																														
SCDD_G tm_59	This function is a macro function, which will write SR1 value to TOMx_CHy_SR1 register. The address of this register is stored in PwmSr1Pt. The input of this function is the index of PwmSr1Pt and SR1 value.																															
SCDD_G tm_60	4.3.3.1.3	SET_PWM_PWMEN(n,en)																														
SCDD_G tm_61	This function is a macro function, which will write enable value to Pwm_PwmEn. The input of this function is the index of Pwm_PwmEn and enable value.																															
SCDD_G tm_62	4.3.3.1.4	SET_SAFETY_PWMEN(n,en)																														
SCDD_G tm_63	This function is a macro function, which will write enable value to Safety_PwmEn. The input of this function is the index of Safety_PwmEn and enable value.																															
SCDD_G tm_64	4.3.3.1.5	GET_PWMSTATUS()																														
SCDD_G tm_65	This function is a macro function, which will return the value of Gtm_PwmStatus.																															
SCDD_G tm_67	4.3.3.1.6	SET_SAFETY_WDIDIS(dis)																														
SCDD_G tm_68	This function is a macro function, which will write disable value to Safety_WDIDis. The input of this function is disable value.																															

ID	Software Component Detailed Design
SCDD_G tm_71	4.3.3.1.7 void Gtm_CheckPwmStatus(void)
SCDD_G tm_72	This function has a cycle time of 100us. This function check the value in TIMx_CHy_CNT, if the last value of TIMx_CHy_CNT is not equal to the current value TIMx_CHy_CNT, then it means this PWM driver is turned on. The bit0 of Gtm_PwmStatus will be set to 1 if PriA is turned on (same logic with bit1, bit2, bit3 for PriB, PriC, PriD).
SCDD_G tm_73	If Safety_PwmEn[0] is false, Gtm_PwmStatus is not 0, and SafetyWDIDis is true, then it means the Primary PWM driver is not turned off by the safety mechanism. In this case, the SBC WDI will be stopped by writing disable value to TOMx_TGCy_OUTEN register.
SCDD_G tm_135	This function will call following function: Gtm_StopWDI()
SCDD_G tm_136	4.3.3.1.8 void Gtm_StopWDI(void)
SCDD_G tm_137	This function will stop the SBC WDI by writing disable value to TOMx_TGCy_OUTEN register. This function has no input and no output.
SCDD_G tm_45	4.3.3.1.9 void Gtm_PwmEnDis_Calc(void)
SCDD_G tm_47	This function has a cycle time of 30us. This function calculate the enable status for Primary, SR and Clamp PWM driver. The enable command is Gtm_PwmEn[i] (i = 0, 1, 2), which is calculated by Pwm_PwmEn[i] and Safety_PwmEn[i]. Only when both Pwm_PwmEn[i] and Safety_PwmEn[i] are 1 will Gtm_PwmEn[i] be set to 1.
SCDD_G tm_49	In this function, the Gtm_PwmEnState[i] will be calculated, which has 4 states and will write value to enable register and SR register of TOM in different state.
SCDD_G tm_50	<u>State GTM_E_DisReg</u> State GTM_E_DisReg will be activated after DSP reset. In this state, the PWM driver will be disabled by writing disable value to enable register. State Transition GTM_E_DisReg -> GTM_E_WaitEn After execute all the function, the state GTM_E_DisReg will be changed to state GTM_E_WaitEn.
SCDD_G tm_53	<u>State GTM_E_WaitEn</u> State GTM_E_WaitEn is used for waiting enable command. No task will be done during this state. State Transition GTM_E_WaitEn -> GTM_E_EnReg If Gtm_PwmEn[i] is 1, the state GTM_E_WaitEn will be changed to state GTM_E_EnReg.
SCDD_G tm_52	<u>State GTM_E_EnReg</u> In this state, the PWM driver will be enabled by writing enable value to enable register. State Transition GTM_E_EnReg -> GTM_E_WaitDis After execute all the function, the state GTM_E_EnReg will be changed to state GTM_E_WaitDis.
SCDD_G tm_51	<u>State GTM_E_WaitDis</u> State GTM_E_WaitDis is used for waiting disable command. No task will be done during this state. After disable command is available, it will write disable duty once. State Transition GTM_E_WaitDis -> GTM_E_DisReg If Gtm_PwmEn[i] is 0, the state GTM_E_WaitDis will be changed to state GTM_E_DisReg.

ID	Software Component Detailed Design
SCDD_G tm_138	This function will call following function: Gtm_EnDisReg() Gtm_EnDisDuty() Gtm_ResetDuty()
SCDD_G tm_78	4.3.3.1.10 void Gtm_EnDisReg(bit en, u16 type)
SCDD_G tm_79	This function enable/disable control of Primary, Sr and Clamp PWM driver. The type are 0, 1, 2, which stand for Pri, Sr, Clamp PWM. The input of this function are enable value and type, and no output.
SCDD_G tm_83	This function will call following function: Gtm_Pri_EnDis() Gtm_Sr_EnDis() Gtm_Clamp_EnDis()
SCDD_G tm_81	4.3.3.1.11 void Gtm_Pri_EnDis(bit enable)
SCDD_G tm_82	This function enable/disable control of Primary PWM driver by writing enable/disable value to TOMx_TGCy_OUTEN register. The input of this function are enable value and no output.
SCDD_G tm_93	4.3.3.1.12 void Gtm_Sr_EnDis(bit enable)
SCDD_G tm_94	This function enable/disable control of Sr PWM driver by writing enable/disable value to TOMx_TGCy_OUTEN register. The input of this function are enable value and no output.
SCDD_G tm_95	4.3.3.1.13 void Gtm_Clamp_EnDis(bit enable)
SCDD_G tm_96	This function enable/disable control of Clamp PWM driver by writing enable/disable value to TOMx_TGCy_OUTEN register. The input of this function are enable value and no output.
SCDD_G tm_84	4.3.3.1.14 void Gtm_EnDisDuty(bit en, u16 type)
SCDD_G tm_85	This function enable/disable duty control of Primary, Sr and Clamp PWM driver. The type are 0, 1, 2, which stand for Pri, SR, Clamp PWM. The input of this function are enable value and type, and no output.
SCDD_G tm_86	This function will call following function: Gtm_Pri_EnDisDuty() Gtm_Sr_EnDisDuty(bit enable) Gtm_Clamp_EnDisDuty(bit enable)
SCDD_G tm_87	4.3.3.1.15 void Gtm_Pri_EnDisDuty(bit enable)
SCDD_G tm_88	Nothing will be done during this function.
SCDD_G tm_97	4.3.3.1.16 void Gtm_Sr_EnDisDuty(bit enable)

ID	Software Component Detailed Design
SCDD_G tm_98	This function control duty of SrA/B PWM by write SR0 and SR1 value to TOMx_CHy_SR0/1 register. When enable is set to be 1, nothing will be done. The input of this function is enable value and no output.
SCDD_G tm_99	4.3.3.1.17 void Gtm_Clamp_EnDisDuty(bit enable)
SCDD_G tm_100	This function control duty of ClampA/B PWM by write SR0 and SR1 value to TOMx_CHy_SR0/1 register. When enable is set to be 1, nothing will be done. The input of this function is enable value and no output.
SCDD_G tm_89	4.3.3.1.18 void Gtm_ResetDuty(u16 type)
SCDD_G tm_90	This function reset duty control of Primary, SR and Clamp PWM. The type are 0, 1, 2, which stand for Pri, SR, Clamp PWM. The input of this function is type and no output.
SCDD_G tm_91	This function will call following function: Gtm_Pri_ResetDuty() Gtm_Sr_ResetDuty() Gtm_Clamp_ResetDuty()
SCDD_G tm_92	4.3.3.1.19 void Gtm_Pri_ResetDuty(void)
SCDD_G tm_101	This function disable PWM drive of PrimaryA/B/C/D all the time by writing PWM_SR_MAX to TOMx_CHy_SR0 and 0 to TOMx_CHy_SR1. The function has no input and no output.
SCDD_G tm_102	4.3.3.1.20 void Gtm_Sr_ResetDuty(void)
SCDD_G tm_103	This function disable PWM drive of SrA/B all the time by writing PWM_SR_MAX to TOMx_CHy_SR0 and 0 to TOMx_CHy_SR1. The function has no input and no output.
SCDD_G tm_105	4.3.3.1.21 void Gtm_Clamp_ResetDuty(void)
SCDD_G tm_106	This function disable PWM drive of ClampA/B all the time by writing PWM_SR_MAX to TOMx_CHy_SR0 and 0 to TOMx_CHy_SR1. The function has no input and no output.
SCDD_G tm_107	4.3.3.1.22 void Gtm_DebugPwm(f32 duty)
SCDD_G tm_108	This function limit the duty value between 0 and 1, and will write DEBUG_PERIOD*duty to GTM_TOM0_CH6_SR1. The input of function is duty and no output.
SCDD_G tm_109	4.3.3.1.23 void Gtm_DebugPwmScope(f32 real, f32 real_div, f32 debug_div)
SCDD_G tm_110	This function calculate the duty value of real and 3.3v for Measurement debug, and will write DEBUG_PERIOD*duty to GTM_TOM1_CH13_SR1, the duty between 0 and 1. The input of function are real, real_div, debug_div and no output.
SCDD_G tm_36	4.3.3.2 QM Function
SCDD_G tm_111	4.3.3.2.1 void Gtm_Init(void)

ID	Software Component Detailed Design																																					
SCDD_G tm_112	This function is the initialization function of Gtm component. This function will initialize the configuration of Gtm_vTom, Gtm_vTim, the value of PwmSr0Pt/PwmSr1Pt and the enable status for Primary, SR and Clamp PWM driver. This function has no input and no output.																																					
SCDD_G tm_113	This function will call following function: Gtm_vTom_cfg() Gtm_vTim_cfg() Gtm_Pwm_Pt_Init() Gtm_PwmEnDis_Init()																																					
SCDD_G tm_114	4.3.3.2.2	void Gtm_vTom_cfg(void)																																				
SCDD_G tm_115	This function is used for configuration of Gtm TOM module. The function will configure the TGC0/1_OUTEN_CTRL, TGC0/1_ENDIS_CTRL, TGC0/1_GLB_CTRL, TGC0/1_FUPD_CTRL register, and also configure the Tom channel, TOM Interrupt and so on. The function also enable TOM channel output and TOM trigger signal. This function has no input and no output.																																					
SCDD_G tm_116	This function will call following function: Gtm_vTomCHcfg() Gtm_vIsr_cfg()																																					
SCDD_G tm_117	4.3.3.2.3	void Gtm_vTomCHcfg(void)																																				
SCDD_G tm_118	This function is used for configuration of Gtm TOM channel, such as CN0, SR0, SR1, CTRL register. Due to the interface difference, the configuration of TOM0_14 and TOM0_15 will be determined by HW version. And also this function will connect the gtm_adc trigger to ADC0 and ADC1 and connect the TOM_OUT to the Port. This function has no input and no output.																																					
SCDD_G tm_119	<p>The GTM TOM channel configuration is shown as following:</p> <table border="1"> <thead> <tr> <th>Signal Name</th><th>Pin No. / Name</th><th>Channel</th></tr> </thead> <tbody> <tr><td>DSPC_DO_PriA_PWM</td><td>P02.0</td><td>TOM0_CH8</td></tr> <tr><td>DSPC_DO_PriB_PWM</td><td>P02.1</td><td>TOM0_CH9</td></tr> <tr><td>DSPC_DO_PriC_PWM</td><td>P02.2</td><td>TOM0_CH10</td></tr> <tr><td>DSPC_DO_PriD_PWM</td><td>P02.3</td><td>TOM0_CH11</td></tr> <tr><td>DSPC_DO_SrA_PWM</td><td>P02.4</td><td>TOM0_CH12</td></tr> <tr><td>DSPC_DO_SrB_PWM</td><td>P02.5</td><td>TOM0_CH13</td></tr> <tr><td>DSPC_DO_SrClampA_PWM</td><td>P02.6</td><td>TOM0_CH14</td></tr> <tr><td>DSPC_DO_SrClampB_PWM</td><td>P02.7</td><td>TOM0_CH15</td></tr> <tr><td>DSPC_DO_NmosA_PWM</td><td>P20.10</td><td>TOM1_CH5</td></tr> <tr><td>DSPC_DO_SBC_WDI</td><td>P20.10</td><td>TOM1_CH0</td></tr> <tr><td>DSPC_DO_SBC_MPS_Debug</td><td>P20.9</td><td>TOM1_CH13</td></tr> </tbody> </table>		Signal Name	Pin No. / Name	Channel	DSPC_DO_PriA_PWM	P02.0	TOM0_CH8	DSPC_DO_PriB_PWM	P02.1	TOM0_CH9	DSPC_DO_PriC_PWM	P02.2	TOM0_CH10	DSPC_DO_PriD_PWM	P02.3	TOM0_CH11	DSPC_DO_SrA_PWM	P02.4	TOM0_CH12	DSPC_DO_SrB_PWM	P02.5	TOM0_CH13	DSPC_DO_SrClampA_PWM	P02.6	TOM0_CH14	DSPC_DO_SrClampB_PWM	P02.7	TOM0_CH15	DSPC_DO_NmosA_PWM	P20.10	TOM1_CH5	DSPC_DO_SBC_WDI	P20.10	TOM1_CH0	DSPC_DO_SBC_MPS_Debug	P20.9	TOM1_CH13

SCDD_G tm_120	This function will call following function: Gtm_vTomCHcfg_HwVer1() Gtm_vTomCHcfg_HwVer0()																																					
SCDD_G tm_121	4.3.3.2.4	void Gtm_vTomCHcfg_HwVer1(void)																																				

ID	Software Component Detailed Design
SCDD_G tm_122	This function is used for configuration of TOMO_14 and TOMO_15, based on B1/C0 HW version. The function will configure the CN0, SR0, SR1, CTRL register. This function has no input and no output.
SCDD_G tm_123	4.3.3.2.5 void Gtm_vTomCHcfg_HwVer0(void)
SCDD_G tm_124	This function is used for configuration of TOMO_14 and TOMO_15, based on B01/B02 HW version. The function will configure the CN0, SR0, SR1, CTRL register. This function has no input and no output.
SCDD_G tm_125	4.3.3.2.6 void Gtm_vIsr_cfg(void)
SCDD_G tm_126	This function is used for TOM interrupt configuration. The function will configure the IRQ_NOTIFY, IRQ_EN, IRQ_MODE register. This function has no input and no output.
SCDD_G tm_127	4.3.3.2.7 void Gtm_vTim_cfg(void)
SCDD_G tm_128	This function is used for GTM TIM module configuration. The function will configure the TIM_MODE, CICTRL, GPR0_SEL, GPR1_SEL, CNTS_SEL, DSL, TIM_EN and so on. This function has no input and no output.
SCDD_G tm_129	4.3.3.2.8 void Gtm_Pwm_Pt_Init(void)
SCDD_G tm_130	This function is used for initializing the value of PwmSr0Pt and PwmSr1Pt. The address of TOMi_CHx_SR0 register will be stored in PwmSr0Pt[i] and the address of TOMi_CHx_SR1 register will be stored in PwmSr1Pt[i]. This function has no input and no output.
SCDD_G tm_131	4.3.3.2.9 void Gtm_PwmEnDis_Init(void)
SCDD_G tm_132	This function is used for initializing the enable status for Primary, SR and Clamp PWM driver. And the Pwm_PwmEn[i], Safety_PwmEn[i] and Gtm_PwmEn[i] of PWM driver will be set to 0. And the Gtm_PwmEnState[i] will be set to GTM_E_DisReg. This function has no input and no output.
